

Schedule B: Basement Flooding Protection Program – Project list: 2022 – 2026

- The projects identified in Table 2 fall into one of 5 categories, namely;

Under Construction Projects: These projects are projects that have already been awarded to a contractor for construction. These works are in various stages of completion. Projects with construction projected to be completed in 2021 have been removed from this list.

Projects with Completed Preliminary Design: Preliminary design for these projects has been completed, and it has been confirmed that the project's preliminary design estimated costs meet the allowable maximum cost of \$68,000 per benefitting property. These projects have been or are in the process of being coordinated with the known capital programs of Transportation Services and other utilities, and are undergoing, or have completed, detailed design.

Projects Undergoing Preliminary Design: Preliminary design for these projects has not yet been completed. For these projects, it has not yet been confirmed that the allowable maximum cost of \$68,000 per benefitting property can be met, and as a result, these projects cannot yet be confirmed for detailed design and construction. These projects are in the process of being coordinated with the capital programs of Transportation Services, other divisions, and utilities.

Projects Planned for Preliminary Design: Preliminary design for these projects has not yet been initiated. These projects are in the process of being assigned to consultants to begin the preliminary design process.

Deferred Projects: Preliminary design for these projects has been completed and the costs exceed the Basement Flooding Protection Program's \$68,000 cost per benefitting property threshold. Due to their elevated costs, these projects are removed from the long-term capital plan and moved into the 'BFPP deferred projects list' to be constructed on an opportunistic basis.

- The description of basement flooding protection projects identified in Table 2 is as follows:

New Storm/Combined/Sanitary Sewers: These are new sewers proposed where a sewer does not currently exist or a secondary relief sewer where a sewer does currently exist. These projects can include several elements such as High Capacity Inlets (HCIs) and Inlet Control Devices (ICDs) on the storm sewer system as well as sealing of maintenance hole covers on the sanitary sewer system. Pipes may be designed to provide temporary storage of excess storm or sanitary sewage.

Storm/Combined/Sanitary Sewer Replacements: These are larger or deeper sewers that will replace already existing sewers. These projects can include several elements such as HCIs and ICDs on the storm and combined sewer system as well as the sealing of maintenance hole covers on the sanitary sewer system. Pipes may be designed to provide temporary storage of excess storm, combined or sanitary sewage.

Bridge/Culvert Improvements: These projects involve increasing the size or slope of a bridge or culvert to improve the conveyance capacity of the overland drainage system.

Road Re-Grading: Re-grading a road involves adjusting the elevation of the road to improve overland drainage. This type of project can also include modifications including curb cuts to direct drainage to new outlets.

High Capacity Inlets: High Capacity Inlets (HCIs) are catch basins designed to capture much more flow than standard catch basins and are typically installed to reduce excessive surface ponding at topographic low points.

Inlet Control Devices: Inlet control devices (ICDs) are flow restrictors installed within catch basins to control the flow rate into the storm or combined sewer system.

Storm or Combined or Sanitary Sewer Storage Tanks: Storage tanks temporarily store excess storm, sanitary or combined sewage. These facilities are typically off-line from the sewer system and are drained via pumps.

Dry Stormwater Pond/Wet Stormwater Pond/Engineered Wetland: Stormwater ponds/Engineered Wetlands temporarily store excess stormwater. Wet stormwater ponds and engineered wetlands always contain water whereas a dry stormwater pond is designed to fully drain between rainfall events. Each of these facilities also provide water quality treatment. Dry stormwater ponds are typically located within parks and the land within the pond can be used for recreational activities between rainfall events.

Oil and Grit Separators: Oil and Grit Separators (OGS) are devices that are installed in maintenance holes to provide water quality treatment. These devices are typically installed in-line with the storm sewer system within the road right-of-way.

Green Infrastructure: Green infrastructure utilizes soil, mulch and plants to remove pollutants from stormwater runoff. Green infrastructure can take a variety of forms such as swales or depressions where runoff from small storms is temporarily detained and treated. These units are typically installed within the road right-of-way.

- Table 3 consists of projects that were previously assigned to the deferred projects list for exceeding the \$32,000 cost per benefitting property threshold. Upon review, and accounting for cost escalation over time, the cost per benefitting property of projects in Table 3 is \$68,000 or lower. These projects have been moved from the deferred projects list to the BFPP planned projects list for future planning, as aligned with program budgets and design and construction capacity.
