

**Grass clippings are 90 per cent water.  
Leave 'em on your lawn for great results.**

**Put away the hose ~ grasscycle instead.**

Grass clippings aren't accepted for yard waste collection. So leave them on the lawn, use them for garden mulch or throw them in your composter.

Valuable nutrients like potassium, phosphorus and nitrogen will be returned to the soil, and that helps develop a healthy root system.

Most importantly, grasscycling provides your lawn with moisture - which means you water less. That should make your yard work 90% easier.

**grasscycling. it grows on you.**
