

# USING PHYSICAL BARRIERS IN WORKPLACES DURING COVID-19

Clear physical barriers such as plexiglass can be used to prevent respiratory droplets from spreading when physical distancing is not possible.

A barrier should extend at least 30 cm or 12 inches around & above the nose of the person who is using it.

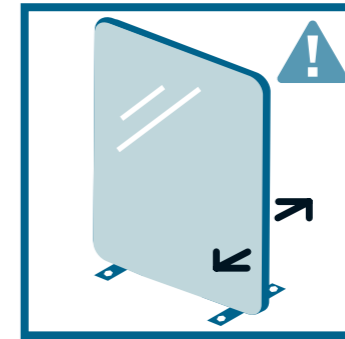

Choose a barrier that is big enough for the tallest person who will be using it.

Barriers should be as wide as the surface, desktop or that the countertop will allow.

Openings should be as small as possible & not located near a person's face.

Install barriers securely so they do not tip, fall or block any emergency exits.

Clean & disinfect barriers at least twice per day or more frequently if visibly soiled.
