Clear physical barriers such as plexiglass can be used to prevent respiratory droplets from spreading when physical distancing is not possible.

- A barrier should extend at least 30 cm or 12 inches around & above the nose of the person who is using it.
- Choose a barrier that is big enough for the tallest person who will be using it.
- Barriers should be as wide as the surface, desktop or that the countertop will allow.
- Openings should be as small as possible & not located near a person's face.
- Install barriers securely so they do not tip, fall or block any emergency exits.
- Clean & disinfect barriers at least twice per day or more frequently if visibly soiled.
