Staying up to date with COVID-19 vaccines lowers the chance of getting, spreading and becoming seriously sick from COVID-19. Getting vaccinated will help youth do the activities they love more safely, including sports, recreation activities, as well as hanging out with friends and family.

**Youth & COVID-19 Infection**

**COVID-19** is a viral infection that mainly affects the lungs. Most youth who have COVID-19 usually get mild symptoms. Some youth can get very sick and may require hospitalization or get long-lasting symptoms including feeling tired, trouble breathing, trouble concentrating or muscle aches.

**Who Can Get the Youth Vaccine?**

It is recommended that all youth stay up to date with their COVID-19 vaccinations, including any booster when eligible. The mRNA vaccines for youth are:

- Safe for all youth, including people with a health condition.
- Safe for anyone who is on medication, is pregnant or breastfeeding.
- Safe even if you have recently had COVID-19.
- Carefully monitored with billions of doses given worldwide.

**Wait to Get Vaccinated**

Youth who have tested positive for COVID-19 should wait until they are feeling better to get vaccinated. To maximize the immune response, it is recommended to wait 8 weeks from when your symptoms started or you tested positive to get the second dose. If self-isolation is required, youth should wait until their isolation period is over. Wait 12 weeks to get a booster dose. Learn about when to get vaccinated after having COVID-19.

**Informed Consent**

Youth should talk about the benefits and risks of getting the vaccine with a parent or trusted adult. Parent consent may not be needed if the person 12 years or older is able to: understand information about the vaccine, why it is recommended and what will happen if they accept or refuse vaccination. Students under 14 years old who get vaccinated at a school clinic during school hours need parent consent.

**How the Vaccine Works**

mRNA vaccines teach our immune system to make antibodies that protect us from COVID-19. The vaccines do not contain the COVID-19 virus, so you cannot get an infection from the vaccine.

The second vaccine dose is given 8 weeks after the first dose. A booster dose is given at least 168 days (6 months) after the second dose. Youth who are moderately to severely immunocompromised should get a primary series of three doses plus two booster doses, when eligible. Learn more about Eligibility Criteria.
COVID-19 Vaccines
Youth 12–17

Vaccine Ingredients and Allergies
The vaccines contain lipids (fats), salts, sugars and buffers. They do not contain eggs, gelatin (pork), gluten, latex, preservatives, antibiotics, or aluminum. The vaccines are safe even if you have food, medication or environmental allergies.

Speak with your health care provider first if you are allergic to polyethylene glycol (PEG). Allergic reactions, including serious reactions (anaphylaxis), are rare. Allergic reactions can be treated and are usually temporary. Get medical help if you have trouble breathing, or develop hives or swelling in the face and throat.

Side Effects and Risks
About 1 in 5 people have side effects from the vaccine. Most are mild to moderate, and last one to three days. Side effects usually mean that the vaccine is working to build your immune system.

Common Side Effects Include:
• redness, pain, itching or swelling at the injection site
• fever
• headache
• feeling tired
• muscle aches
• joint pain
• chills
• nausea and/or vomiting

Myocarditis and Pericarditis
Myocarditis and pericarditis (types of heart inflammation) can occur following a COVID-19 infection and can be serious. Rarely, it can occur after getting vaccinated. If it occurs after vaccination, it is mild and gets better on its own within a few days. Get medical attention if you develop chest pain, shortness of breath, or your heart is pounding/racing in the first few weeks after vaccination. Vaccination is still recommended as the benefits are greater than any risk.

For people 5 – 29 years of age, Pfizer is the preferred vaccine because of lower reported rates of myocarditis and pericarditis after getting vaccinated. Youth who have a weak immune system should speak to their health care provider about which mRNA is recommended for them.

COVID-19 and Other Vaccines
It is safe to get other vaccines at the same time as your COVID-19 vaccine. Waiting 14-days before or after your COVID-19 vaccine is not required.

Consult a Health Care Provider if you:
• Take medications that weaken your immune system — you may want to time your vaccination with your medications.
• Had an allergic reaction four hours after receiving a previous COVID-19 vaccine dose.
• Have severe allergies to any of the vaccine ingredients.
• Had Multisystem Inflammatory Syndrome (MIS-C).
