

# Novavax Nuvaxovid COVID-19 Vaccine

April 13, 2022

In February 2022, Health Canada approved the [Novavax Nuvaxovid](#) vaccine for people aged 18 years or older. This vaccine is for people who are unable (e.g. due to an allergy) or unwilling to get a different type of COVID-19 vaccine.

## How the Vaccine Works

[Novavax](#) is a protein subunit vaccine. It uses small pieces of a protein to teach our immune system to make antibodies that recognize and fight COVID-19. The vaccine does not contain the COVID-19 virus and cannot give you the infection.

## Vaccine Schedule

Two doses are required and a booster is recommended, even though [Novavax](#) is not currently authorized as a booster by Health Canada. It takes two weeks after vaccination for protection.

## Mixing Vaccines

[Novavax](#) can be used for any of the first two doses or as a booster, even if the previous vaccine was different (e.g. one dose of another COVID-19 vaccine and one dose of [Novavax](#)).

## Vaccine Benefits

The COVID-19 [mRNA](#) vaccines (e.g. Pfizer-BioNTech and Moderna Spikevax) are preferred because they give stronger protection against serious illness, hospitalization and death from COVID-19, including variants. Clinical trials showed that [Novavax](#) works well to prevent getting sick from COVID-19. Long-term protection is not known yet. We also do not know how effective Novavax is for people who have a weak immune system, have an autoimmune condition, had COVID-19 in the past, or are pregnant or breastfeeding.

## Side Effects and Risks

Some people may have side effects after vaccination – most are mild to moderate and last one to three days. Side effects usually mean that the vaccine is working. Common side effects include redness, pain, or swelling at the injection site, mild fever, headache, feeling tired, muscle aches, joint pain, chills, nausea and/or vomiting.

If you have a serious reaction to the vaccine or the reaction does not go away after 3 days, tell your health care provider. Public health keeps track of side effects to ensure the vaccines continue to be safe.

# Novavax Nuvaxovid COVID-19 Vaccine

Myocarditis and pericarditis are types of inflammation in different parts of the heart. It can occur after getting COVID-19 and can be serious. This has rarely occurred after getting Novavax, and is being closely monitored. If it does occur, most cases are mild and treated with medication and rest, and get better in a few days.

Get medical attention if you develop chest pain, shortness of breath, or racing heartbeat after vaccination. Vaccination is still recommended as the benefits outweigh the risks.

## Vaccine Ingredients and Allergies

The vaccine contains Polysorbate 80, salts, sugars and buffers. It does not contain eggs, gelatin (pork), gluten, latex, preservatives, antibiotics, or aluminum. In rare cases, serious allergic reactions (anaphylaxis) can occur. Allergic reactions can be treated and are usually temporary. Seek medical attention if you have trouble breathing, hives, or swelling of the face and throat.

People with a serious allergic reaction to another COVID-19 vaccine or polyethylene glycol (PEG) can consider getting [Novavax](#).

## Delay vaccination if you:

- Have a fever or any COVID-19 symptoms, wait until you are feeling better before getting vaccinated.
- Are required to [self-isolate](#), please reschedule your appointment for a later date, when your isolation period is over.

## Speak with a health care provider first, if you:

- Are pregnant, could be pregnant or are breastfeeding
- Have an auto-immune condition
- Have a weakened immune system because of an illness or treatment
- Had an allergic reaction within four hours after getting the first dose of a COVID-19 vaccine
- Have a severe allergy to any [Novavax](#) vaccine ingredients, including an allergy to Polysorbate 80
