Basement Flooding Study (Area 65)

During heavy rain, sewers can become overloaded with stormwater runoff. This puts pressure on the City's sewer systems and overland drainage routes, such as roads, local rivers and streams, which can lead to basement flooding.

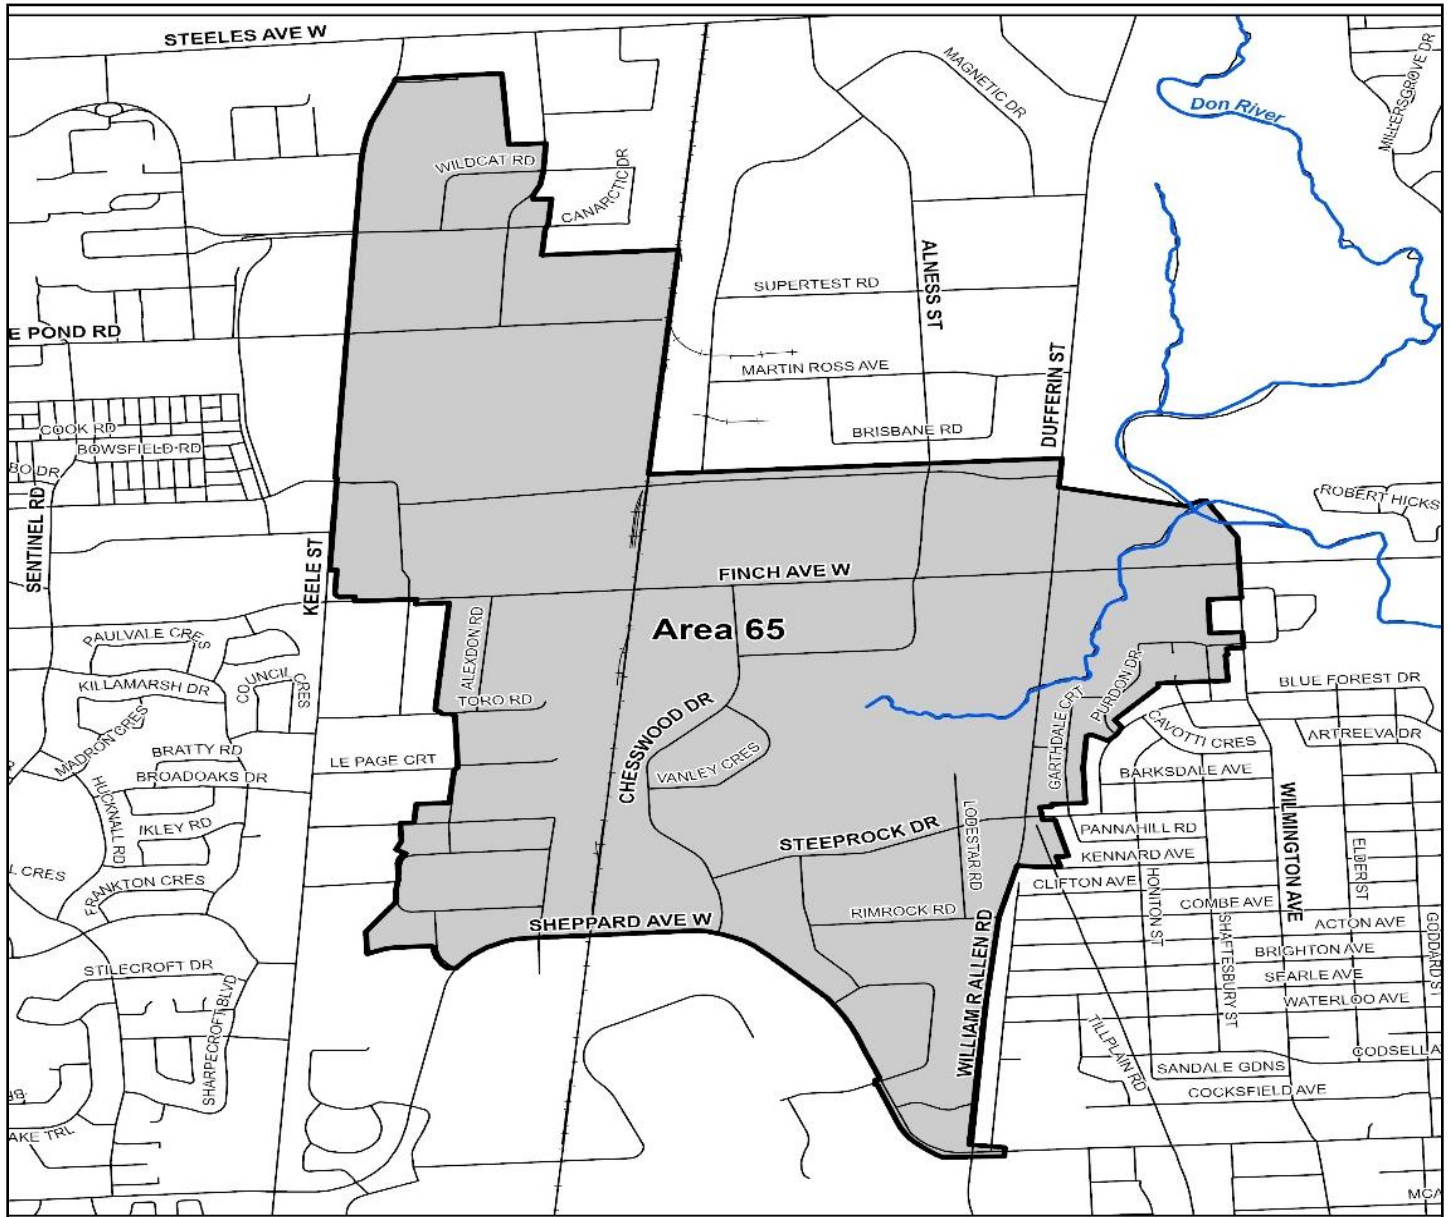

The City of Toronto is studying ways to help reduce future surface and basement flooding in the Don River watershed within Study Area 65 which falls within the North York area. Through our investigations of drainage and flooding, the City has evaluated alternatives and developed solutions to improve the City's sewer systems and reduce the risk of flooding.

Find out more about our study and what is recommended by visiting us online.

--	---

Study Area

The study area is roughly bordered by Keele Street to Dufferin Street/Allen Road, from Finch Avenue West to Sheppard Avenue West.

Study Recommendations

To help to reduce the risk of future basement flooding in the study area and increase the capacity in the City's storm and sanitary collection and drainage systems, the City is recommending solutions such as new and upsized sewers deepening of sewers, in-line storage tanks (storage sewers), new catch basins, and inlet control devices in catch basins.

Where solutions are located outside of the City's right-of-way, the study process below has been followed to evaluate alternative solutions. The City has evaluated two solutions at Canarctic Drive, near Keele Street. At this location, we are recommending upsized sanitary and storm sewer and catch basin improvements.

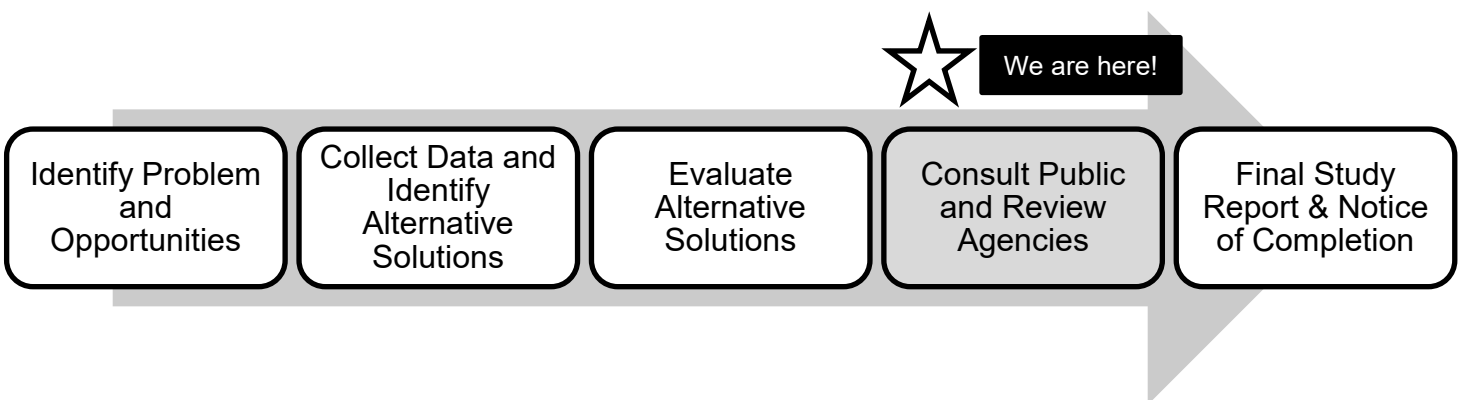

To view all the recommended infrastructure improvements, please visit the project webpage.

The City continues to encourage property owners to take responsibility for the maintenance of drainage systems on private property. These include:

- Lot grading, driveway drainage and private property catch basins
- Foundation drains in the basement and garage
- Sump pumps and backflow valves
- Clogged drains due to private tree roots or items poured down the drain such as grease

Study Process

This study follows Municipal Class Environmental Assessment process which promotes good environmental planning by determining and managing the potential effects of a project prior to implementation. The EA process includes identifying the problem or opportunity to be addressed, developing and evaluating a range of alternative solutions, providing opportunities for public input, and identifying a preferred solution. This study is being undertaken as a Schedule 'B' project.

Next Steps

Once the City has reviewed all comments received, it will review and confirm the preferred solution and finalize the Project File report. The study report will be made available for a 30-day public review.
